

The final answer can look the same while hidden decision pressure shifts.

Veridion runs matched proxy-pair audits for hiring and employment AI. The key finding is not only whether the output changes. It is whether the model's decision margin moves against a protected proxy even when the visible answer stays acceptable.

VISIBLE OUTPUT

Same

HIRE remains HIRE

HIDDEN DELTA

Measured

decision margin movement

STATISTICS

FDR

multiple-test correction

Method

Hold qualifications constant, change only the proxy signal, compute paired margin deltas, correct p-values with FDR, and report output plus hidden pressure.

Why it matters

A vendor can pass a surface output test while still showing systematic internal pressure against a proxy group. That is exactly the kind of issue buyers want caught before rollout.

Artifact

A bias-pressure certificate with baseline group, proxy group, output, margin delta, corrected p-value, threshold, and review recommendation.
